

How to Plant Grafted Tomatoes

Grafted tomatoes are quite different from the average, regular tomato. Because each plant consists of two plants fused together, they require different care and yield different results. Ezra's Organics grafted tomatoes have root systems that are 4-5 times larger than a regular tomato. They grow much taller, with more lush foliage and will produce several pounds more fruit than the average tomato plant!

Keep the graft line above the soil! This is the single most important factor when planting a grafted tomato. If the graft line is buried, the scion (top part of the plant) will grow its own roots and the benefits from our superior root stock will be lost.

How to Plant, Step by Step:

1. Dig a deep hole (about 6 inches) for your tomato start.
2. Add organic soil amendments and fertilizer to the bottom of the hole.
3. Identify the graft line (see photo above) on your plant and keep it in mind, throughout planting.
4. Hold the stem gently with one hand, while supporting the bottom of the pot with the other. Gently tip the pot and remove the plant and root ball.
5. DO NOT pull on the stem, as this could fracture or damage the graft point.
6. Place the root ball in the hole, on top of the amendments, and build up the soil around it.
7. Press the soil in firmly around your plant, continuing to watch the graft line and make sure that the soil does NOT go above it.
8. Water the soil around the base of your plant deeply. A good soak will help the plant adjust to the transition.
9. Add your support system or cage around the plant. Insert the plant tag into the soil, a foot or so in front of the plant, so you can remember which variety it is.

Prepare to be amazed!
